

Nurse Hourly EDA

Question 2: Is there a relationship between location quotient (LQ) and hourly wage?

Hypothesis: Places with smaller LQ have higher wages

In 2019, places with smaller location quotients (<1) have higher wages

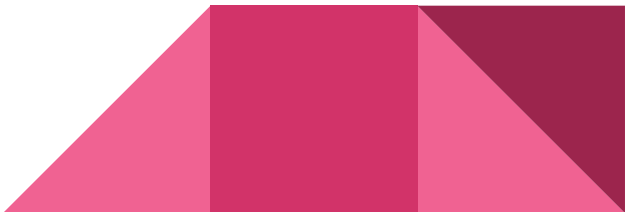

- General decreasing trend in 2019
- Hourly wage remained constant in previous years.

Project 4: Drug overdose and alcohol related deaths

Dennis Campoverde-Lema, Samantha Parras, and Jodie Chen

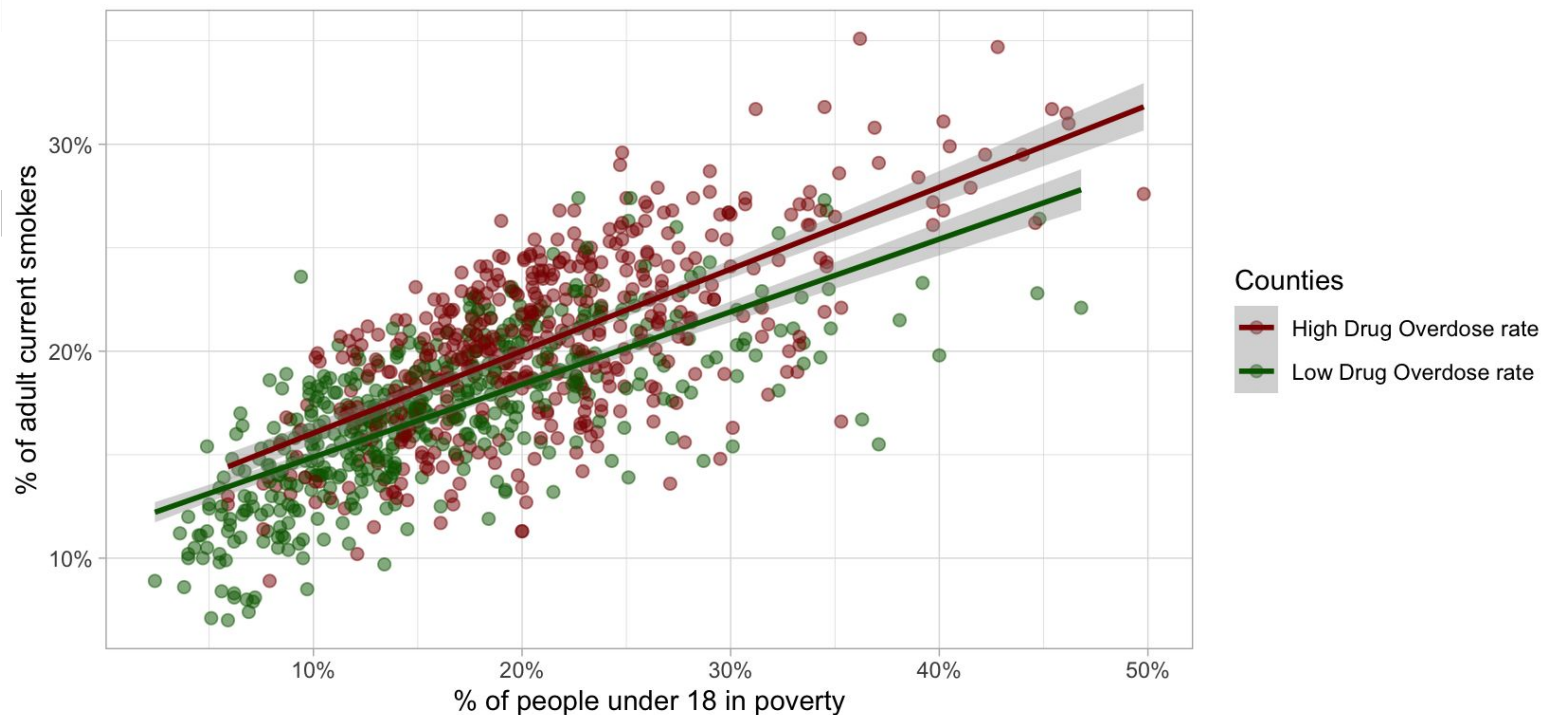

Are there demographic and social factors that are predictors of drug overdose deaths and alcohol-related incidents deaths(e.g., driving accidents)?

Data Description

- **Source:** 2024 County Health Rankings
 - Key variables were renamed for clarity and ease for interpretation. For example:
 - Drug_overdose_death_raw_value to Drug_Overdose_Deaths
 - Alcohol_impaired_driving_death_raw_value to Alcohol_impaired_Driving_Deaths
 - **Demographics:** Population by age, race, and gender
 - **Socioeconomic factors:** Unemployment Rate, Income Inequality, Education Rates, etc.
 - **Data Processing:**
 - Converted all variables to numeric.
 - missing or zero values
- 

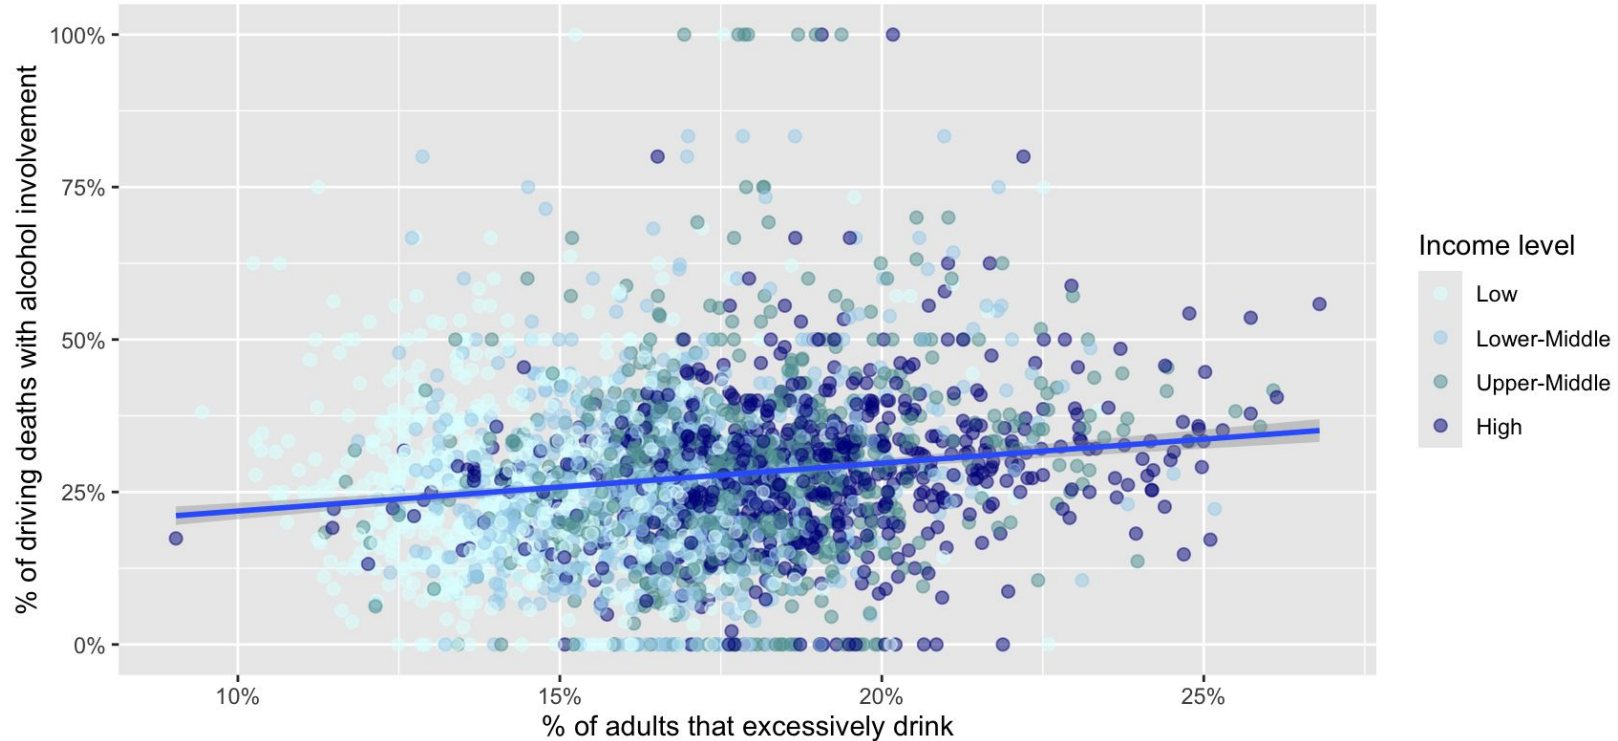

EDA - drug overdoses

Counties with high overdose rates have high rate of current smokers

EDA - alcohol impaired deaths

Counties with higher median income have higher proportion of adults that excessively drink

*Restricting to counties with population > 3000

Modeling Strategy

1. Data:

- a. 2024 County Health Rankings

2. Analytical Methods:

- a. **Correlation Matrix:** Finding variables that correlate with our two response variables
- b. **Linear Models:** Baseline understanding of relationships.
- c. **Ridge Regression:** Addresses multicollinearity, improves model stability.
- d. **Lasso Regression:** Enhances model by selecting significant predictors.

3. Validation:

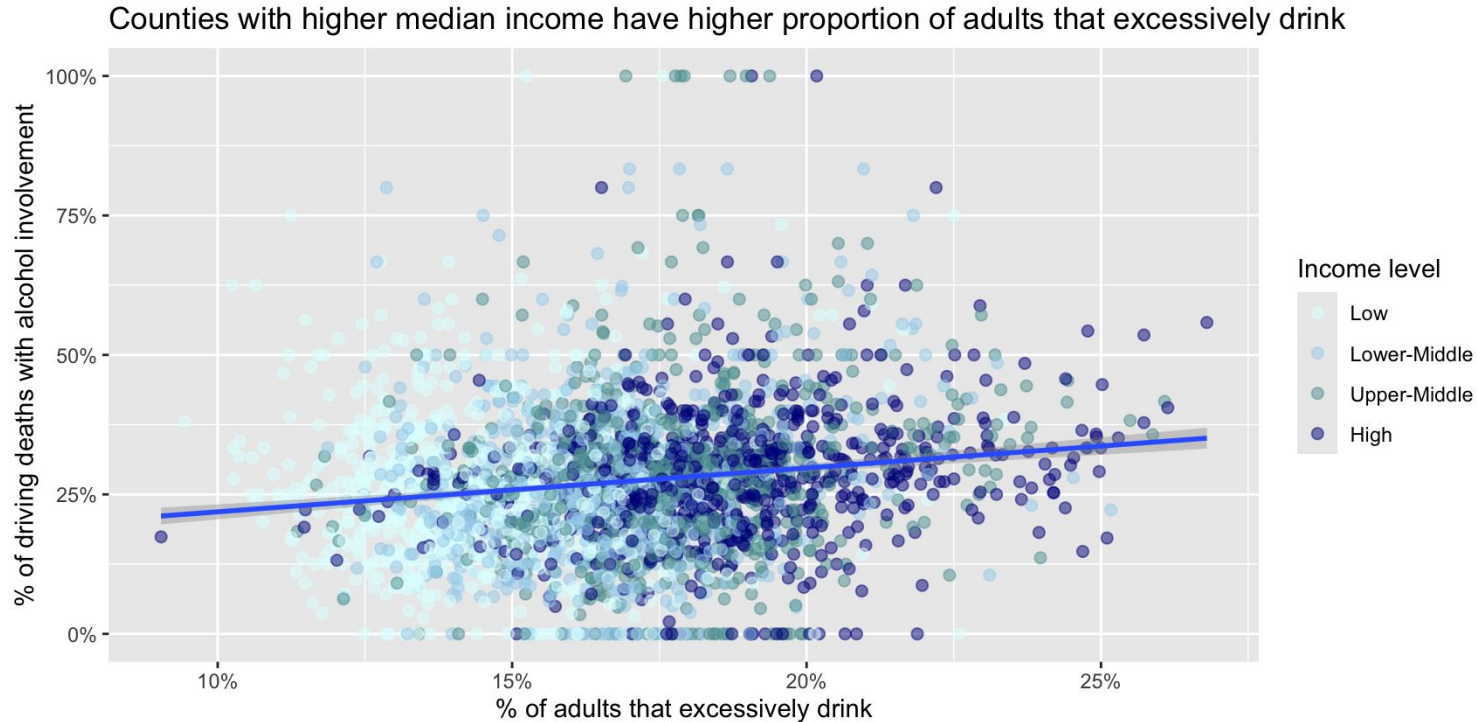

- a. Use cross-validation to test model accuracy.

Plan of Action

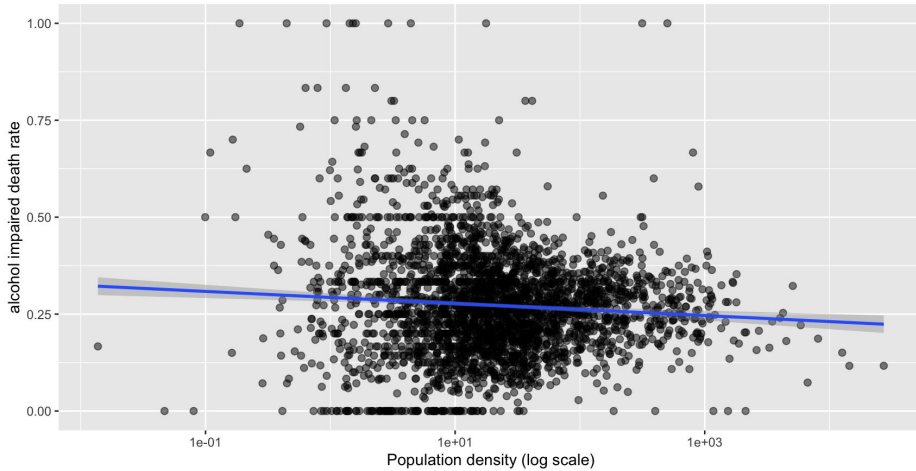

- **Completed Steps:**
 - Data acquisition, Cleaning, and correlation analysis
- **Ongoing Steps:**
 - Refining ridge and lasso models.
- **Next Steps:**
 - Creation of new variables that might improve model performance.
 - Implementing cross-validation techniques to validate the models.
 - Analyzing the output to draw meaningful conclusions.
 - Documenting findings and methodologies.
 - Developing the final presentation slides and rehearsing the presentation.
- **Next Deadline:** July 12, 2024.

Revised EDA - alcohol impaired deaths (no facets–keep)

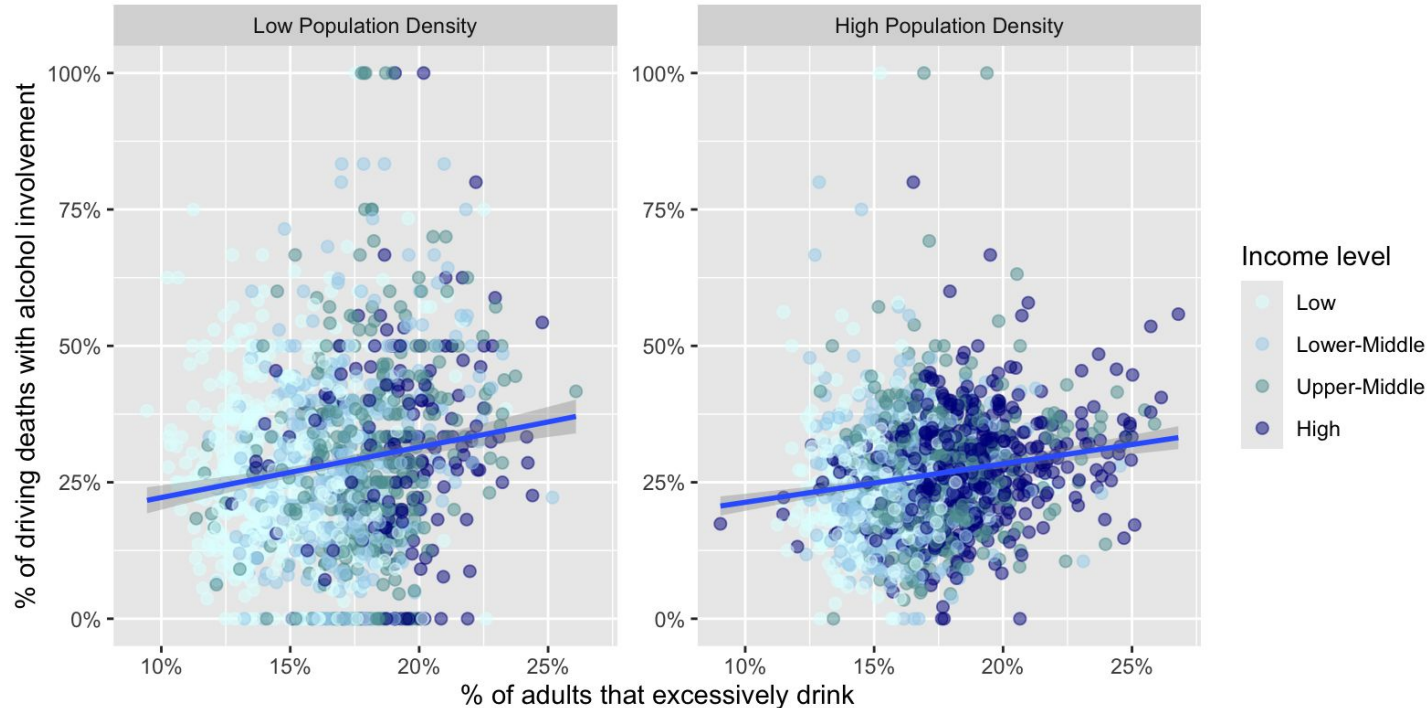

*Restricting to counties with population > 3000

Population Density vs Alcohol Impaired Deaths Rate

Revised EDA - alcohol impaired deaths (2 facets)

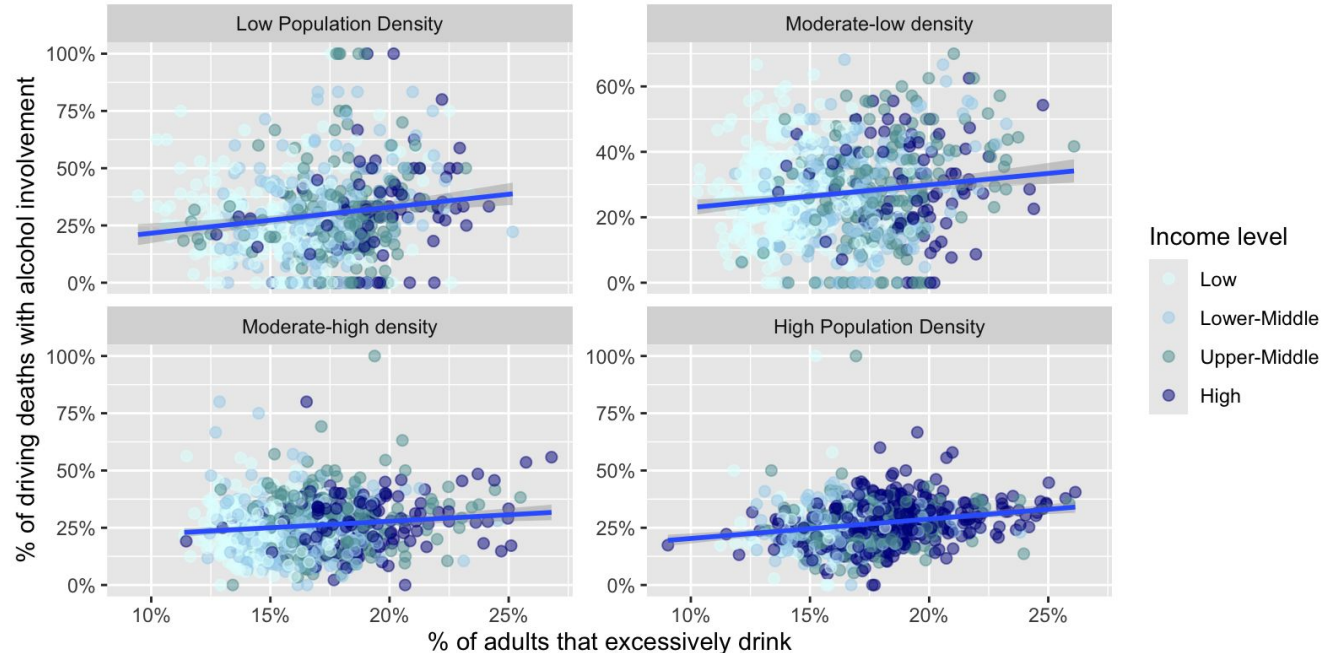

*Counties with higher median income have higher proportion of adults that excessively drink

*Restricting to counties with population > 3000

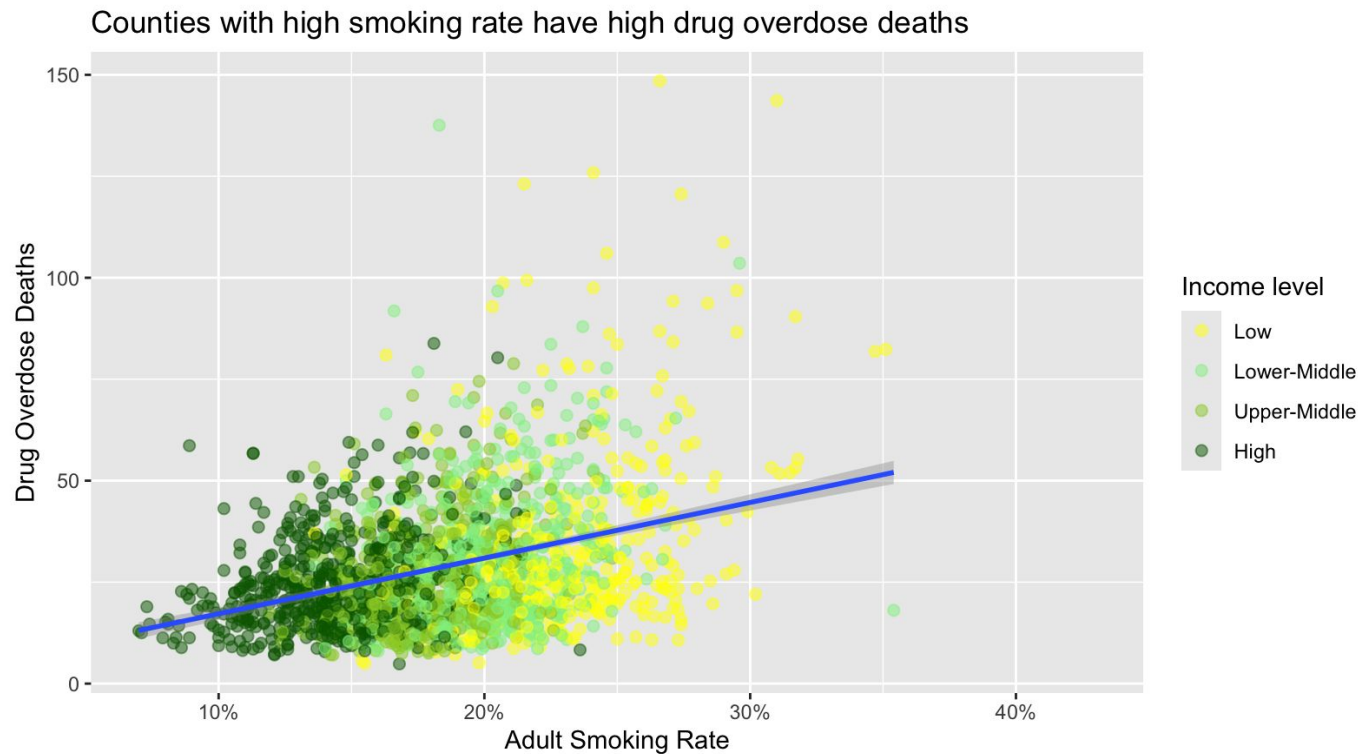

Revised EDA - alcohol impaired deaths (4 facets)

*Counties with higher median income have higher proportion of adults that excessively drink

*Restricting to counties with population > 3000

Revised EDA - drug overdoses

Adding more relevant variables

Social–community safety

1. Homicides (1368/1767 NA:not NA)
2. Suicides

Social–education

1. Disconnected youth (%) – 1965 NA : 1170 NA
 - a. Numerator is num of people (16-19) neither working or in school
 - b. Denominator is total county population, ages 16-19.

Modeling suggestions

- Variable selection

- Lasso variable selection (built in linear model)
- Fit model with variables we selected ourselves (using EDA)
- Bayesian sparse regression using the horseshoe prior (R)

- Model selection

- Multilevel (mixed effects modeling),
- random forest (be prep to show why chose this model)
- Maybe a black box to show simpler, interpretable models are better or perform just as well
